1x6 FINELINE

1x8 FINELINE

INSTALLATION TIPS

- Let fingerjoint primed poplar interior trim acclimate before installation. It should be conditioned to an indoor environment, where it will be installed, 48 hours prior to installation. Upon delivery, stack fingerjoint primed poplar trim on racks, stickers or 2 x 4's above and off the garage floor to prevent the possible absorption of moisture from the concrete floor.
- Fingerjoint primed poplar interior trim may be hand nailed or fastened with pneumatic finish nailers. When hand nailing, pre-drilling is suggested, but not necessary. Installers who have not worked with poplar before should test and adjust the air pressure as needed for their specific equipment. The best fasteners are 15 to 18 gauge brad and pin nails.
- Carbide tip blades are recommended.
- Like all wood products, poplar can absorb and release moisture with changes in relative humidity. The normal range of interior humidity is 40% to 80%. Thus, some expansion and contraction of fingerjoint primed poplar interior trim may be possible.
- A finish coat, of oil or latex based paint, should be field applied to Poplar Interior Trim.
- Fingerjoint primed poplar interior trim and fineline is designed for interior use only.
